DATECH 2014, May 20th 2014

OVERVIEW

- Background: Trading Consequences
- OCR accuracy estimation
 - Motivation
 - Related work
 - OCR errors in text mining (eye-balling data versus quantitative evaluation)
 - Computing text quality
 - Manual vs. automatic rating
- Summary and conclusion

TRADING CONSEQUENCES

- JISC/SSHRC Digging into Data Challenge II (2 year project, 2012-2013)
- Text mining, data extraction and information visualisation to explore big historical datasets.
- Focus on how commodities were traded across the globe in the 19th century.
- Help historians to discover novel patterns and explore new research questions.

PROJECT TEAM

Ewan Klein, Bea Alex, Claire Grover,
Richard Tobin: *text mining*

Colin Coates, Andrew Watson:
historical analysis

Jim Clifford: *historical analysis*

James Reid, Nicola Osborne: *data management, social media*

Aaron Quigley, Uta Hinrichs:
information visualisation

OCR-ED TEXT

The Fishermen's Mass.

By fair Trellee bay, oh! did you e'er wander,
Where quiet and beauty are blended in one,
Watching the brooklets their pearly drops squander,
Bright gems soon to form for the brow of the sun?
And have you e'er heard the swell of devotion,
Like chorus of angels from depths of the sea,
As mass hath been said by those sons of the ocean,
The fishermen humble of quiet Trellee?
Oh! I have been there, and seen them all kneeling,
Their faces turned upward beneath the bright sky,
And heard their low throbs of worshipping feeling,
And seen pure devotion gush out from each eye;
And oft, 'mid the world's rough battles and sorrow,
I've thought of that fishermen's mass of the sea,
And pray'd for such faith in brighter to-morrow
As shone from each face in the bay of Trellee.

The fishermen's mass to High Heaven hath ascended,
The first star is looking with smiles from the sky,
The sea gulls in air with their bright wings extended,
Proclaim that the fishermen's harvest is nigh.

Brave Dermot looks up with a spirit all lowly,
And, wiping the brine from his storm-beaten head,
Cries "Mother of Jesus, and saints the most holy,
Betrend!—Sure, the fishermen's mass it was said."

Upon the dark storm, from the fisherman's dwelling,
There shines a faint light like a star through a cloud;
Fast bugling her babe to her bosom high swelling,
Tight clasping her rosary, Mary's low bowed.

She looks through her tears to her Father in heaven,
Then, kissing her child, cries, "Ah, blessed be that
And bless'd be the saints! now the promise is given!
Sure, mass it was said—he'll be here in a while."

Again and again with fond kisses bedewing
Her baby's soft cheek, as the rosebud as fair;
Again and again her look upward renewing,
This song, sweet and solemn, she breathes on the air:

When upon the stormy deep,
Fishermen their vigils keep,
Wherefore should their lovers weep?
Thou art there,
When the storm is raging high,
And the waves leap to the sky,
Wherefore should we fret and sigh?
Thou dost care.

Stronger than the tempest's rage
Is Thy power from age to age;
Thou dost once its wrath assuage,
And can still
We will own Thy mighty power,
Even in the darkest hour,
And receive us blessed down
All Thy will.

WHY OCR ACCURACY ESTIMATION?

- A reasonable amount of already digitised books (some with very bad text quality). Can we mine some of them now.
- To what extent do OCR errors affect text mining? What is their effect when dealing with big data?
- What text is of sufficient high quality to be understood? How bad is too bad? What happens to the rest?
- Can we measure text quality? How does it compare to human quality ranking of text?

RELATED WORK

- Some OCR output contains character-based accuracy rates which can be very deceptive.
- Popat, 2009:
 - Extensive study on quality ranking of short OCR'd text snippets in different languages. Examined rank order of text snippets of inter-, intra- and machine ratings.
 - Compared spatial and sequential character n-gram-based approaches to a dictionary-based approach (web corpus, capped at 50K most frequent words per language).
 - Compared random to balanced (stratified) sampling.
 - Metric: average rank correlation.

OCR ERRORS AND BIG DATA

- Are OCR errors negligible when mining big data to detect trends?
- Our data suffers from all the common OCR error types (at best just a few character insertions, substitutions and deletions), at worst much worse (page upside down).
- Character confusion examples:
 - e -> c, a -> o, h -> b, l -> t, m -> n, f -> s

OCR ERRORS AND TEXT MINING

- Need a more quantitative analysis.
- Built a commodity and location recognition tool.
- Evaluated it against manually annotated gold standard.

	TP	FP	FN	P	R	F
TM: com	797	342	310	0.70	0.72	0.71
TM: loc	1,599	489	1,549	0.77	0.51	0.61
IAA: com	283	112	109	0.72	0.72	0.72
IAA: loc	582	65	189	0.90	0.76	0.82

OCR ERRORS AND TEXT MINING

- 32.6% of false negative commodity mentions (101 of 310) contain OCR errors (= 9.1% of all commodity mentions in the gold standard)
 - *sainon, rubher, tmber*
- 30.2% of false negative location mentions (467 of 1,549) contain OCR errors (= 14.8% of all location mentions in the gold standard)
 - *Montreai, Montroal, Mont- treal and 10NTREAL.*

PREDICTING TEXT QUALITY

- Can we compute a simple quality score for a large data collection (i.e. over 7 billion words)?
- How easily can humans perform document-level quality rating?

COMPUTING TEXT QUALITY

- Simple document-level quality score to get a rough estimate of how good a document is.
- Word tokens found in an English dictionary (aspell “en”) and Roman/Arabic numbers over all word tokens in the text.
- Scores range between 0 and 1.
- Caveat: it does not consider historic variants.

$$SQ = \frac{W_{good}}{W_{all} + 1}$$

COMPUTING TEXT QUALITY

- Score distribution over the English Early Canadiana Online data (55,313 documents).

DATA PREPARATION

- Early Canadiana Online (books, magazines and government publications relevant to Canadian history ranging from 1600 to the 1940s)
- 83,016 documents (almost 4 million images containing text mostly in English and French but also in 10 First Nation languages, European languages and Latin).
- Language identification (or meta data information) to retain only English content (55,313 documents).

DATA PREPARATION

- Ran the automatic scoring over all English ECO documents.
- Applied stratified sampling to collect 100 documents by randomly selecting:
 - 20 documents where $0 \geq SQ < 0.2$,
 - 20 documents where $0.2 \geq SQ < 0.4$,
 - 20 documents where $0.4 \geq SQ < 0.6$,
 - 20 documents where $0.6 \geq SQ < 0.8$,
 - 20 documents where $0.8 \geq SQ < 1$.
- Shuffled documents and removed the quality score.

MANUAL RATING

- Two raters looked at each document and rated it on a 5-point scale.

5 ... OCR quality is high. There are few errors. The text is easily readable and understandable.

4 ... OCR quality is good. There are some errors but they are limited in number and the text is still mostly readable and understandable.

3 ... OCR quality is mediocre. There are numerous OCR errors and only part of the text is readable and understandable.

2 ... OCR quality is low. There is a large number of OCR errors which seriously affect the readability and understandability of the majority of the text.

1 ... OCR quality is extremely low. The text is so full of errors that it is not readable and understandable.

INTER-RATER AGREEMENT

AUTOMATIC VS HUMAN

AUTOMATIC VS HUMAN

AUTOMATIC VS HUMAN

AUTOMATIC VS HUMAN

AUTOMATIC VS HUMAN

AUTOMATIC VS HUMAN

THRESHOLD?

CONCLUSION

- We applied a simple quality scoring method to a large document collection and showed that automatic rating correlates with human rating.
- Document-level rating is not easy to do manually.
- Automatic document-level rating is not ideal but it give us a first “taste” of how good the quality of a document is. It is much more consistent than a person doing the same task.
- Many OCR errors are noise in big data but when added up they affect a significant amount of text.
- We found that named entities are effected worse than common words.
- HSS scholars need to be made much more aware of OCR errors affecting their search results for historical collections.

FUTURE WORK

- Consider publication date and digitisation date when doing OCR quality estimation.
- Examine the bad documents identify those worth post-correcting.
- AHRC big data project (Palimpsest) on mining and geo-referencing literature set in Edinburgh.
Collaboration with literary scholars interested in loco-specificity and its context in literature.

SYSTEM

MINED INFORMATION

- Example sentence:

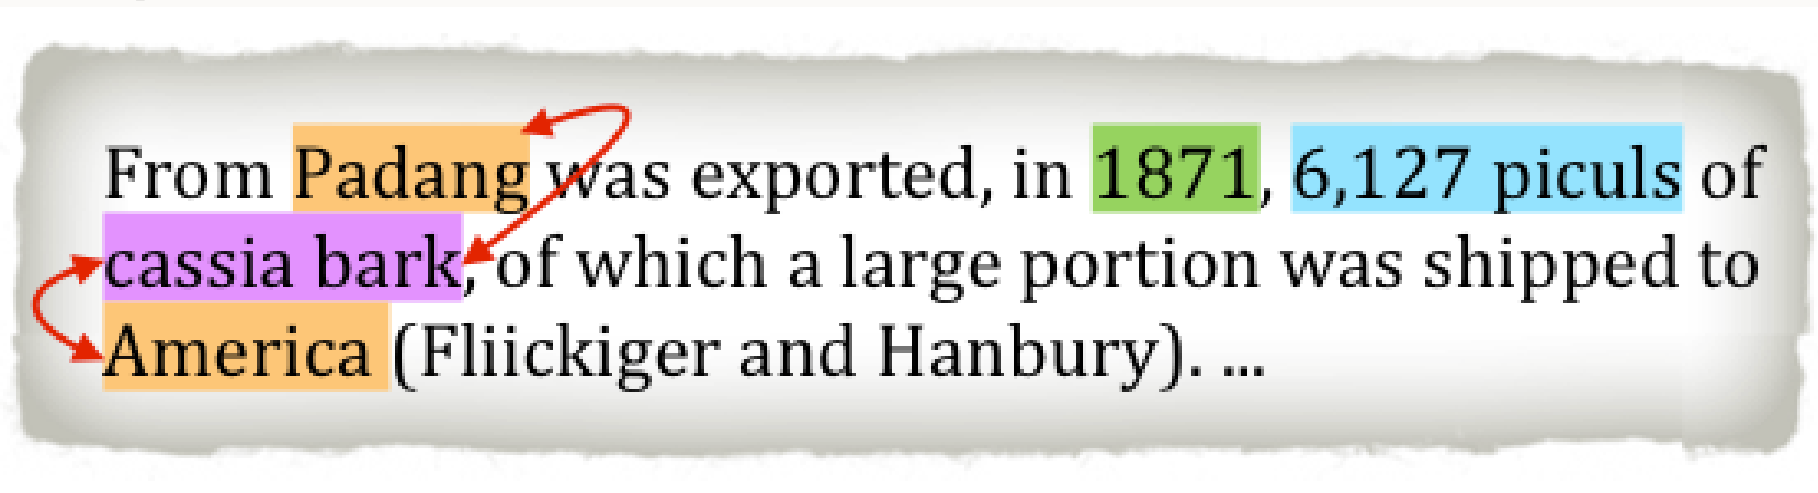

From Padang was exported, in 1871, 6,127 piculs of cassia bark, of which a large portion was shipped to America (Flickiger and Hanbury). ...

- Normalised and grounded entities:

- commodity: cassia bark [concept: Cinnamomum cassia]
- date: 1871 (year=1871)
- location: Padang (lat=-0.94924;long=100.35427;country=ID)
- location: America (lat=39.76;long=-98.50;country=n/a)
- quantity + unit: 6,127 piculs

MINED INFORMATION

- Example sentence:

From Padang was exported, in 1871, 6,127 piculs of cassia bark, of which a large portion was shipped to America (Flickiger and Hanbury). ...

The diagram shows the sentence with several entities highlighted in colored boxes: 'Padang' (orange), '1871' (green), '6,127 piculs' (blue), 'cassia bark' (purple), and 'America' (orange). Red arrows indicate relationships: one arrow points from 'Padang' to 'cassia bark', and another points from 'cassia bark' to 'America'.

- Extracted entity attributes and relations:

- origin location: Padang
- destination location: America
- commodity–date relation: cassia bark – 1871
- commodity–location relation: cassia bark – Padang
- commodity–location relation: cassia bark – America

EDINBURGH GEOPARSER

only 50 objects displayed, zoom in or deselect some features

	Name	country	feature	km to center
1	P Ciudad Victoria	Mexico	seat of a first-order administrative division	11435.01 km
2	P Victoria	Seychelles	capital of a political entity	5126.1 km
3	P Victoria	Canada	seat of a first-order administrative division	11180.98 km
4	A State of Victoria	Australia	first-order administrative division	14782.65 km
5	P Hong Kong	Hong Kong	capital of a political entity	9688.28 km
6	P Victoria	Malaysia	seat of a first-order administrative division	10558.79 km
7	P Durango	Mexico	seat of a first-order administrative division	11882.99 km

9	A Victoria	Honduras	second-order administrative division	10832.96 km
10	P Victoria	United States	seat of a second-order administrative division	10954.12 km

CONCLUSION

- Importance of two-way collaboration between technology and humanities expert in digital HSS projects.
- Value of iterative development and rapid prototyping.
- Geo-referencing text is very important for historical analysis.
- Most OCR errors are noise in big data but HSS scholars need to be made more aware of OCR errors affecting their search results for historical collections.
